

IEA Greenhouse Gas R&D Programme

CO₂ Capture and Storage Global Developments

John Gale

IEA Greenhouse Gas R&D Programme

Introduction

- Review the status of CCS internationally
- Current CCS project status worldwide
 - Highlight recent developments
- Discuss challenges ahead

International Policy

- The main international frameworks covering CCS are:
 - The Law of the Sea (UNCLOS)
 - London Convention
 - OSPAR Convention (North West Europe)
 - Climate Change Framework
 - Kyoto Protocol
 - Considerable progress has been made in recent years

International Acceptance

- London Convention
 - Meetings of Scientific Group and Legal Working Group held in April 2006
 - Technical Working Group meeting recommended that:
 - CCS is a waste management option to be considered by Contracting Parties' in their approaches to mitigating greenhouse gas emissions
 - Legal Working Group agreed to amend Annex 1 of Protocol to the Convention to allow CO₂ to be included under wastes that can be disposed of (Paragraph 1.8)
 - Only in sub sea geological structures,
 - The waste is overwhelmingly of carbon dioxide,
 - No wastes or other matter are added.
 - Proposals from Working groups submitted to first Statutory Meeting of the Protocol Parties
 - 30 October – November 3, 2006
 - Amendment to London Convention accepted
 - CCS in sub sea geological storage structures now legal under London Convention

Role for CCS in Mitigating Climate Change?

- "No single technology option will provide all of the emission reductions needed to achieve stabilization, but a portfolio of mitigation measures will be needed."*
- "CCS has the potential to reduce overall mitigation costs and increase flexibility in achieving greenhouse gas emission reductions."*
- "Widespread application of CCS would depend on (...) diffusion and transfer of the technology to developing countries and their capacity to apply the technology"*
- "Economic potential of CCS would amount to 220 - 2,200 GtCO₂ (60 - 600 GtC) cumulatively"*
- " would mean that CCS contributes 15 to 55% to the cumulative mitigation effort worldwide until 2100, averaged over a range of baseline scenarios."*

IPCC SRCCS Summary for Policy Makers

Geological Storage

“Available evidence suggests that worldwide, it is likely that there is a technical potential of at least about 2,000 GtCO₂ (545 GtC) of storage capacity in geological formations”

*“It is likely that the technical potential for geological storage is sufficient to **cover the high end** of the economic potential range, but for specific regions, this may not be true.”*

IPCC SRCSS Summary for Policy Makers

Local Risks

CO₂ pipelines:

*“The local risks associated with CO₂ pipeline transport could be **similar to or lower** than those posed by hydrocarbon pipelines in operation.”*

Geological storage: with:

*“appropriate **site selection** ..., a **monitoring** program to detect problems ..., a **regulatory system**, appropriate use of **remediation methods** to stop or control CO₂ releases if they arise”*

“The local health, safety and environment risks of geological storage would be comparable to risks of current activities - natural gas storage, EOR, deep underground acid gas disposal.”

IPCC SRCCS Summary for Policy Makers

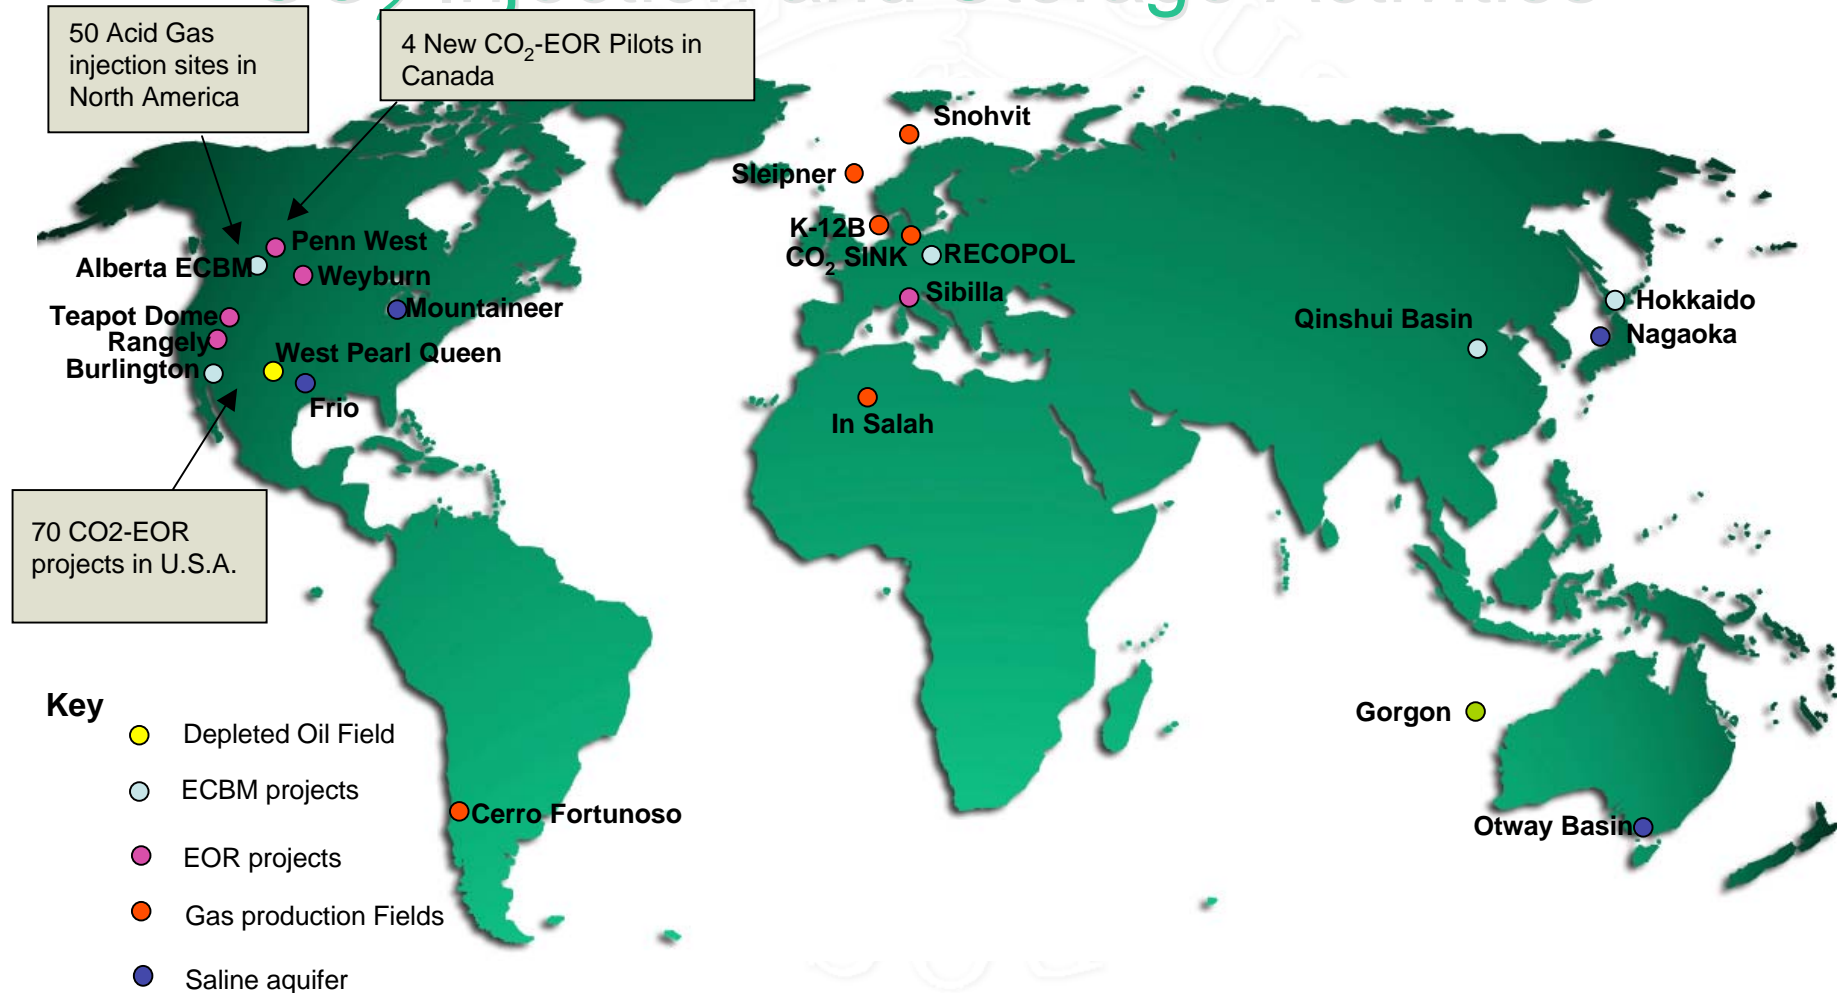

CCS Project Proliferation

- Commercial activity primarily in oil and gas sector
- Number of research projects injecting/capturing CO₂ increasing
 - Expect up to 10 more in USA in coming years as part of Regional Partnership programmes
- Now seeing pre-commercial/commercial developments for power sector projects
 - Australia, Canada, Germany, Norway, UK & USA
 - No direct financial incentives

CO₂ Injection and Storage Activities

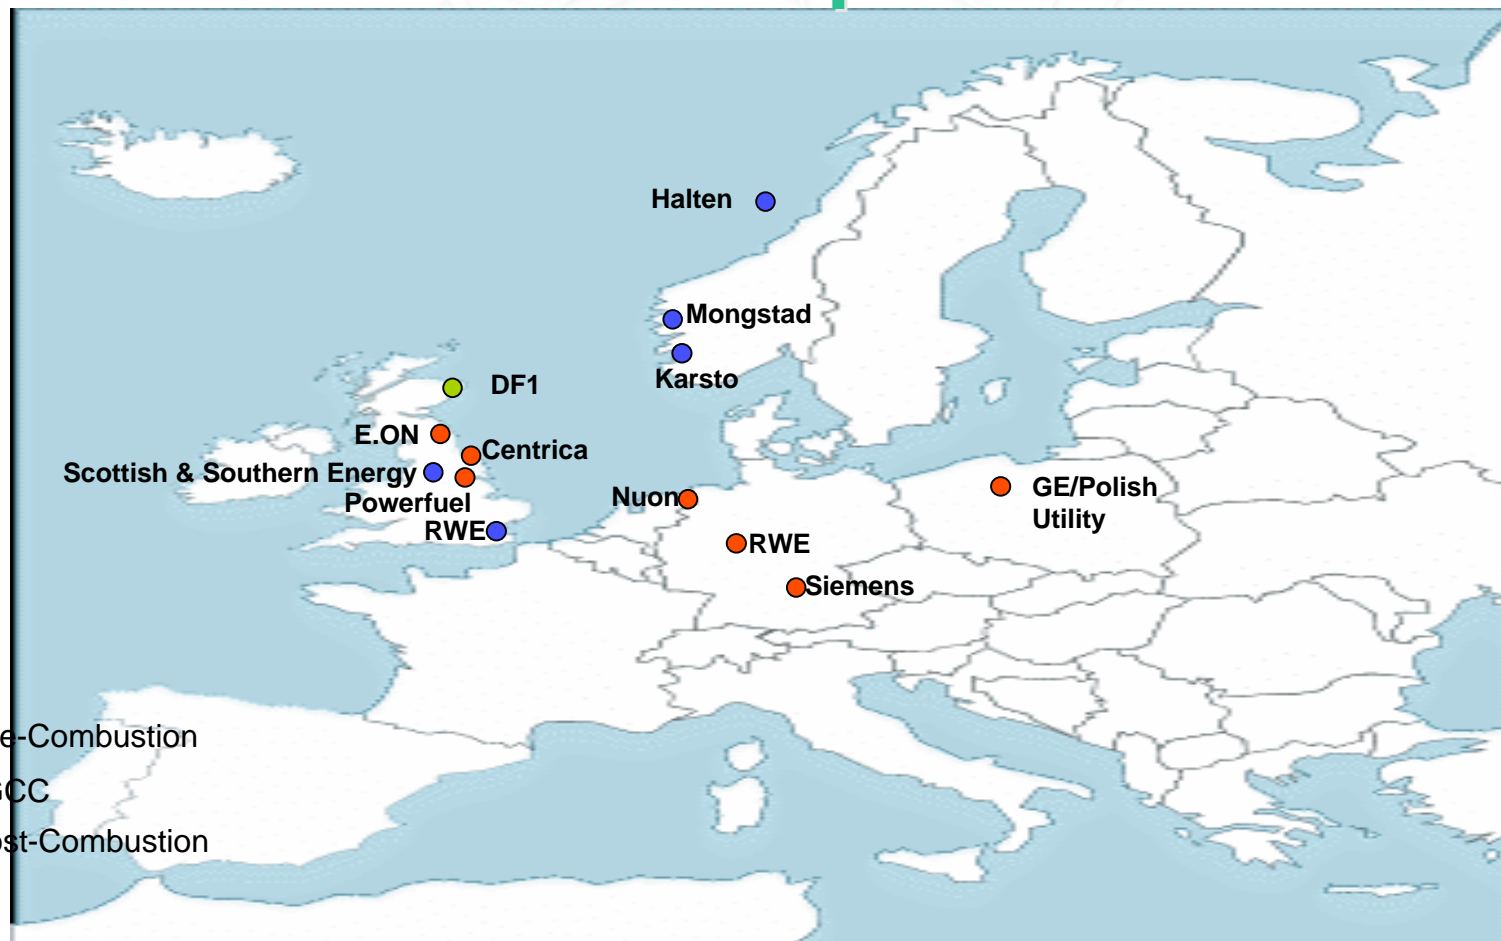

Proposed Integrated CCS Projects

Proposed Integrated CCS Projects- Europe

Key

- Pre-Combustion
- IGCC
- Post-Combustion

Developing Country Activities

- China
 - EC/UK funded nZEC project
 - EC funded COACH project
 - EC funded GEOCAPACITY
- India
 - IEA GHG/DEFRA funded source/store matching study
 - US DOE funded Basalt study
 - Indian funded CO₂ capture test facility proposed
- Asia Pacific Partnership
 - Australian Government \$6m programme to support research on CCS developments in China and India

Norwegian Approach

Rotterdam Energy Port and CO₂ Hub

Port has existing and planned power generation capacity

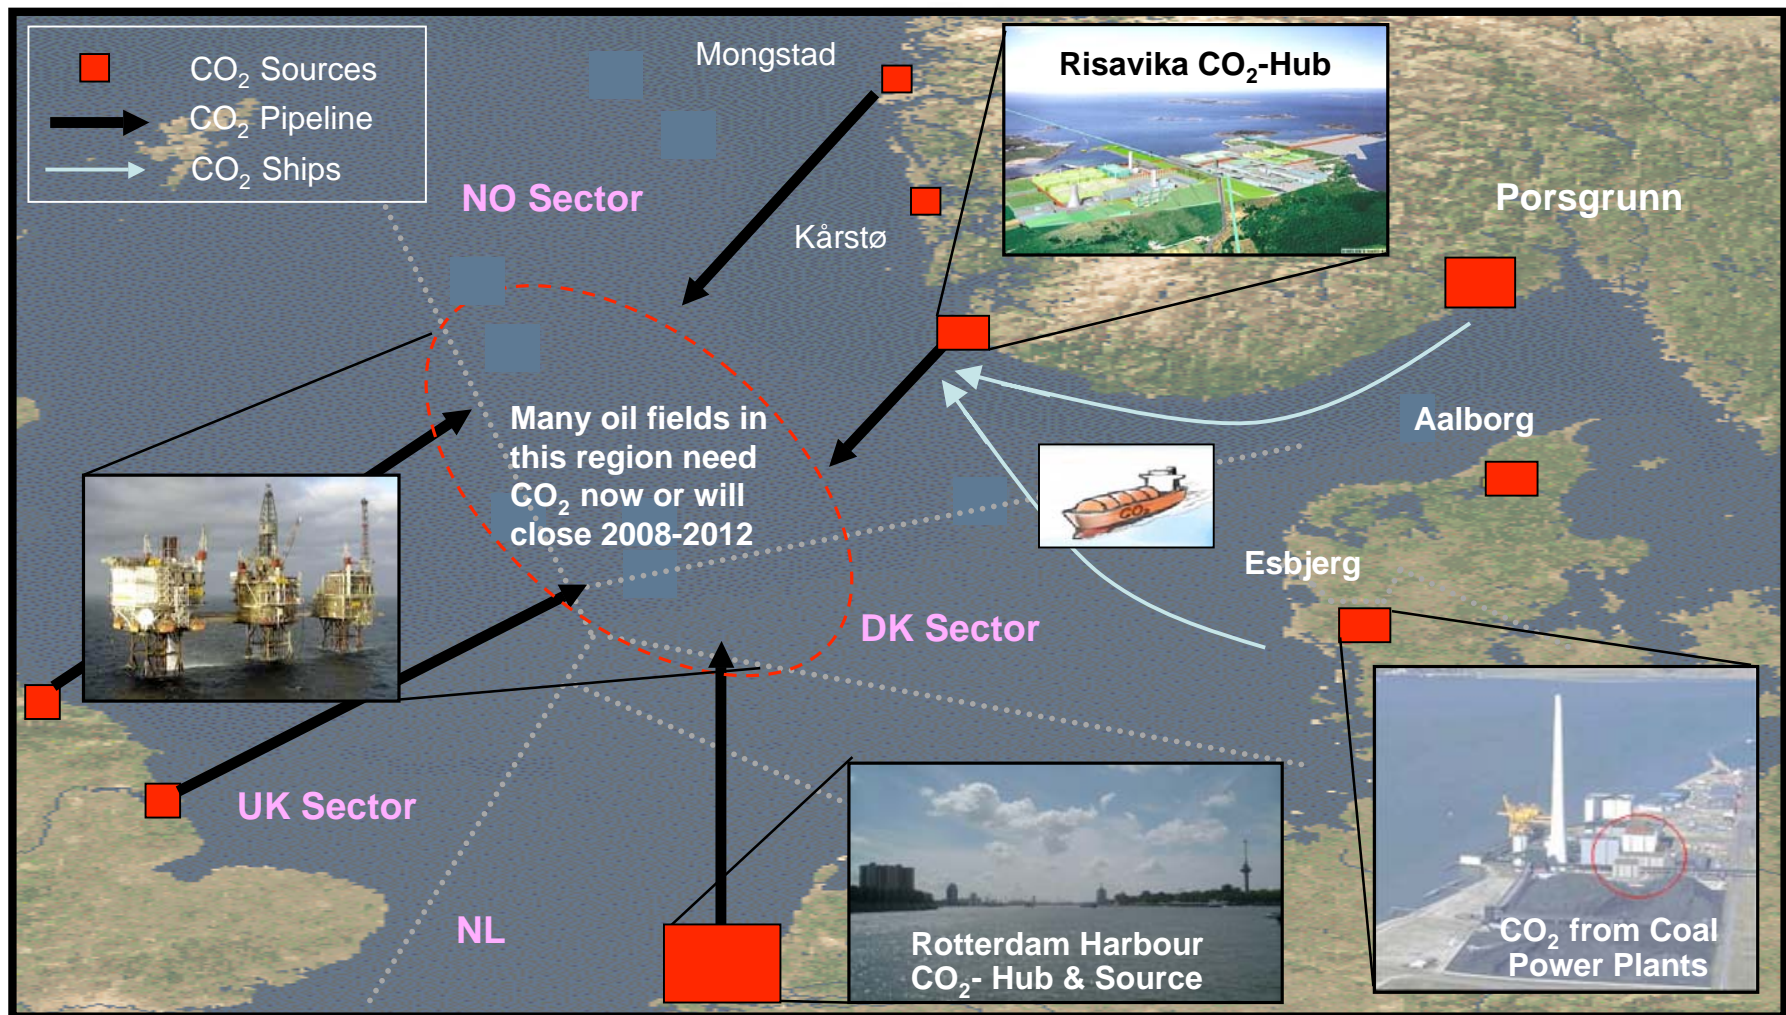

Existing oil and gas pipeline infrastructure as an energy import hub

Collect CO₂ from Netherlands and export through existing infrastructure to depleted gas fields

Challenges Ahead

- Issues that need to be addressed
 - Safety/permanence
 - Developed regulatory system
 - Market for CCS
 - Public Awareness/Education

Safety/Permanence

- For a CCS operation we cannot say there will be never be leakage
- Industry statistics show there will be fugitive emissions from pipelines and surface facilities
 - Low level and intermittent
 - Can quantify such emissions
- These emissions are distinct from the storage formation
 - If they occur these will be very low level (seepage) and occur over long time periods
 - Likely to cause local environmental impacts

Safety/Permanence

- Need to engineer for zero leakage from the storage formation
- 5 component plan:
 - Detailed site characterisation
 - Reservoir simulation
 - Risk assessment
 - Monitoring programme
 - Remediation programme

Summary of Monitoring Experience

- No firm evidence from any of the large scale projects that leakage is occurring
 - Weyburn (~5 years), Sleipner (~10 years), Rangeley (~25 years)
- Only one project has identified any surface seepage
 - There are doubts about the data
- Monitoring lifetimes are short <25 years
- Cannot quantify seepage rates

Regulatory Developments

- Need for regulatory systems essential to implement projects in near term
- Quicker to amend existing regulations than develop new ones
 - European Commission
 - Inclusion of CCS undertake existing environmental and waste pollution directives
 - European Nations
 - Netherlands - adapted existing laws
 - UK - regulatory task force established
 - Norway - permitting CCS under existing laws
 - USA
 - Adapting UIC programme legislation
 - Australia
 - State and Federal Governments involved
 - Gorgon review under way

CCS Market Drivers

- Currently high oil and gas prices will drive some CO₂ injection projects
 - Low incremental cost for storage
 - Sleipner, In-Salah, Snohvit
 - Economic incentive through increased hydrocarbon production
 - Weyburn, K-12B
- Norwegian situation
 - Tax incentives for offshore emission reduction driving project development

CCS Market Creation

- Long term CO₂ market needs to be created
- Emissions Trading Scheme
 - European system immature
 - Current price will not finance CCS projects (€0.9/t CO₂)
 - Current volatility will not encourage long term investment (Range €0.6 to 29/t CO₂)
- Need to drive down cost of CCS
 - 20-40% cost reductions achievable through replication
- In short term projects may need government support
- Longer term a stable trading market establishes itself
 - CO₂ supply/storage infrastructure needs to develop

Norwegian Initiative

- New initiative in Norway to create a CO₂ supply infrastructure
 - Part public sector/part private sector enterprise
 - Establish a CO₂ supply infrastructure for Norway to realise its CO₂-EOR potential
 - Leave behind a supply infrastructure that can then be used for CO₂ storage
 - Announced in Autumn 2006

Public Awareness/Education

- Public awareness on CCS is currently limited
- Need to build public awareness to ensure projects do not meet public resistance
- Need to urgently start an education programme
 - Open and transparent
 - Happening at pilot project scale in some countries
 - Australia, Europe, Canada and USA
 - Need more concerted engagement programmes
 - CATO programme and Japan
 - Need more demonstration projects with public engagement
 - In-Salah
 - Need to be aware that local issues could dominate in planning reviews

Need to Break Taboo's

Lake Nyos

- Detailed study demonstrated that geologically Lake Nyos is untypical of a CO₂ storage site
- Cannot use Nyos incident as a reference for possible release from a CO₂ storage site
- Peer reviewed study and paper available
